

Important Notice Regarding Safety Stops when used with DOVEDV10

Congratulations on your purchase of the Astro-Physics DOVEDV10 saddle plate. We hope you find your new DOVEDV10 dovetail plate to be functional and versatile.

The unique design of the DOVEDV10 features a longer 3-knob clamp design for maximum safety and support. Additional insert grooves at the front and back of the plate extend the available balancing range than would otherwise be impossible.

As a result of this innovative design, standard safety stops (screws) may not be long enough to catch and prevent accidental slippage.

If you use a D-style plate with your telescope, please make sure your plate's stop screws extend down enough to catch the saddle plate.

For your convenience, the DOVEDV10 ships with a nut that can be added to the stop screw to provide additional reach. The bolt and stop screw is shown in the example below:
