

Park 1 Bug in Keypad version 4.17

Updated: 01-02-16, 8:00 pm central time

How can you work around this issue in the meantime?

First turn on power. Let the mount initialize normally with Autoconnect = Yes. If you are in Autoconnect = NO, enter the Location and then enter Resume From Park (don't Resume from Park1). Now go into the Setup menu, then Time/date menu. Change the date to 01/01/2015. Press the GoTo button, you should hear a beep, which means that the date changed successfully. If you don't hear the beep, go back and check the date again. Once you have the date set to 2015, turn off power. **Wait 5 seconds, turn power back on, go thru the startup procedure again as before, then** verify your 3 park positions, starting with Park3, then Park2 and finally Park1.
